- Squad
- Platoon
- Company
- Battalion

COMPATIBLE WITH:

- Military Radios
- Private cellular
- Iridium and other Satellites
- Mesh Network
- Any combination of the above

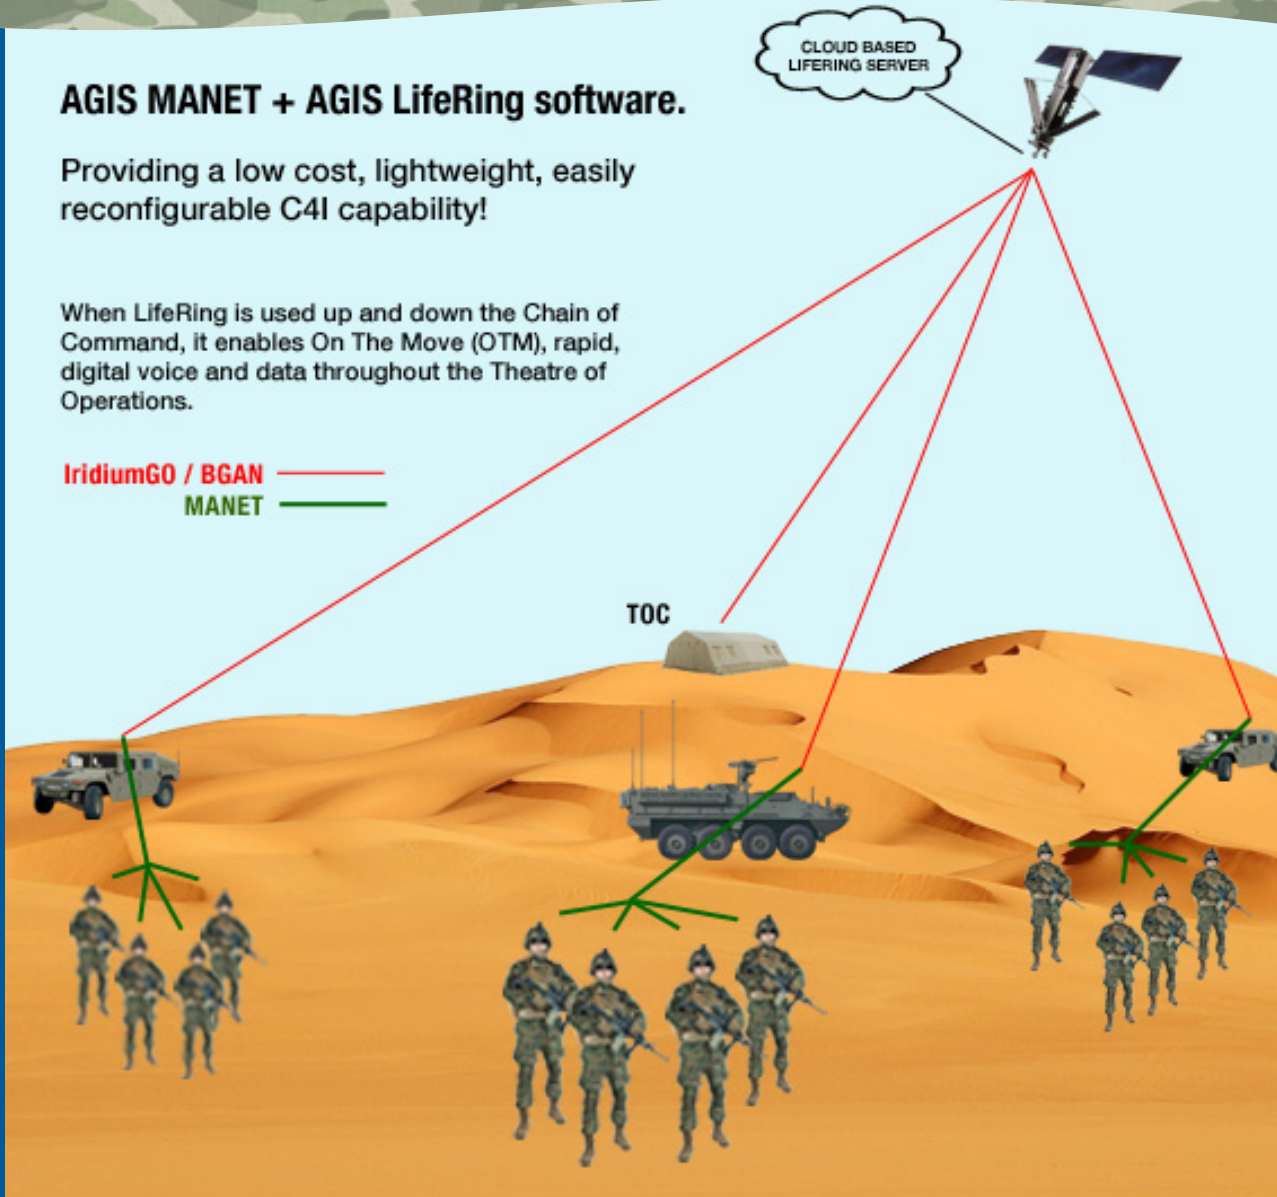

AGIS MANET + AGIS LifeRing software.

Providing a low cost, lightweight, easily reconfigurable C4I capability!

When LifeRing is used up and down the Chain of Command, it enables On The Move (OTM), rapid, digital voice and data throughout the Theatre of Operations.

IridiumGO / BGAN ————

MANET ————

Thanks to a recent Department of Energy (DOE) contract, LifeRing can offer full military MANET and Satellite capability enabling On The Move (OTM) communications at a fraction of the cost associated with normal military procurements. The Tactical Operations Center (TOC) is able to stay in communication with mobile command vehicles via BGAN or Iridium Satellite or, when ranges permit, via encrypted cellular or military radios.

In addition, AGIS LifeRing's automatic Failover Server and Server to Server communications assure that when communications are disrupted, LifeRing systems can be automatically reconfigured at individual and different Command Level.

AGIS's highly compressed messaging is ideally suited for satellite communication and enables TOCs at all levels to act as a relay for communications up and down and across the Chain of Command.
