

AGIS First Responder Application Featured on Verizon's Public Safety Portal

Advanced Ground Information Systems (AGIS) has been selected to feature their LifeRing First Responder application on the Verizon Public Safety Portal.

Last year, Verizon introduced their public safety private core, which separates data traffic of public safety mobile users from commercial users across Verizon's network. Public safety users will have their data immediately recognized as public safety with priority access at the tower and through the network. The private core leverages leading edge networking technology to provide security, flexibility, and reliability.

The Verizon Public Safety Portal is an extension to their public safety private core and features technology products and solutions to enhance the effectiveness of Responders and Responder Agencies.

LifeRing has interfaces to Police and Fire P25 Radios and can interoperate with other First Responder units using other cellular frequencies including Band 14. LifeRing can also digitally communicate with First Responders that are using Common Alerting Protocol (CAP) messages for data exchange.

LifeRing is compatible with and has been tested with Verizon's Software Defined Perimeter (SDP) which provides an on-demand, air-gapped, network designed to defeat network-based attacks. When Verizon's Software Defined Protocol (SDP) is available, LifeRing utilizes it to further assure the integrity and security of our data link transmissions.

"We are proud to be selected as one of Verizon's trusted technology solutions" stated AGIS' CEO, Cap Beyer. "We are dedicated to the First Responder community and I'm confident that our application will be a great Command and Control system for any size agency."

LifeRing – Complete, Affordable C4I Everywhere!
