

AGIS LifeRing Addresses Security at Every Level

Our LifeRing system is designed to be the most comprehensive and easy to use Command and Control system in the world...and the most secure.

From onboarding users to segmenting those users into groups to encrypting the data and communications exchanged between all users...we have addressed security at every level.

Groups can be based on echelon, command structure, mission, security level or location. Groups can be set at the user's level or at the command level which would then distribute group and password information down the chain of command with new, additional groups set up at each level to insulate the upper levels.

All data that is transmitted is first protected using AGIS proprietary message exchange formats that are only known to AGIS and one U.S. entity. The data is then encrypted prior to transmission using AES 256-bit encryption by the APP. If AGIS is being used in an integrated mode with our preferred Zero Trust provider, the data is then again AES 256 bit encrypted. If it is being used with US military radios it is also Type 1 encrypted.

For more information on our security protocols, please check out our latest video at:
